Figure 2a

[illegible]

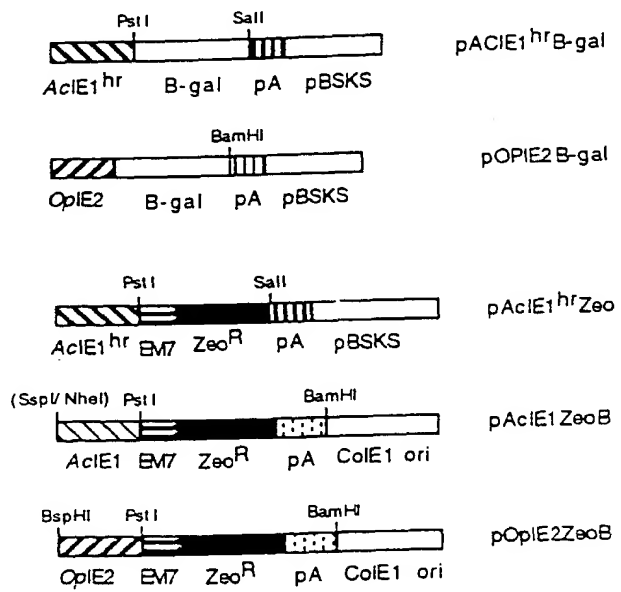

Figure 3

Figure 1 consists of three vertically stacked line graphs showing the viable cell number (x 10⁶/ml) over a 14-day period for three different cell lines: Kc1, SL2, and Sf9. Each graph includes a legend for six concentrations of 1,25-(OH)₂D₃: 0 (open squares), 10 (filled squares), 25 (open circles), 50 (open triangles), 75 (filled circles), and 100 (filled triangles). Error bars are present for all data points.

Kc1: The y-axis ranges from 0 to 14. The 0 concentration shows a significant increase, peaking at approximately 12.5 x 10⁶/ml around day 9. Other concentrations remain relatively low, mostly below 5 x 10⁶/ml.

SL2: The y-axis ranges from 0 to 6. The 0 concentration shows a peak of about 6.5 x 10⁶/ml around day 5, followed by a decline. Other concentrations show lower peaks, generally between 2 and 4 x 10⁶/ml.

Sf9: The y-axis ranges from 0.0 to 2.5. The 0 concentration shows a peak of about 2.4 x 10⁶/ml around day 5. Other concentrations show lower peaks, generally between 0.5 and 1.5 x 10⁶/ml.

Figure 4a

Figure 4b

Figure 1 consists of five vertically stacked line graphs, each representing a different *E. coli* strain. The y-axis for all graphs is 'Viable Cell Number (10⁶/ml)' and the x-axis is 'Time (Days)'. Each graph shows the growth of the strain over 8 days under six different concentrations of ZnO nanoparticles: 0, 50, 100, 250, 500, and 1000 µg/ml. The data points are represented by different symbols for each concentration, and error bars are included for each point. The growth is generally inhibited by ZnO, with higher concentrations showing more significant inhibition. The Kc1::pAcIE1hZeo strain shows the most robust growth across all concentrations, while the Sf9::pOplE2ZeoB strain shows the most significant inhibition at higher concentrations.

Strain	Concentration (µg/ml)	Day 0	Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7	Day 8

Figure 13a

Western blot analysis showing the 62 kDa band in various cell lines. The lanes are labeled as follows: Kc1 Control, Kc1 Transient, Kc1 Stable, SL2 Control, SL2 Transient, SL2 Stable, Hi5 Control, Hi5 Transient, Hi5 Stable, Ld Control, Ld Transient, Ld Stable, Sf9 Control, Sf9 Transient, and Sf9 Stable. Molecular weight markers are indicated on the left at 83, 62, and 47 kDa. The 62 kDa band is present in all lanes, with varying intensities, indicating successful expression and detection of the protein across all cell lines and conditions.

Figure 16b

A dark, grainy, black and white photograph showing a dense, textured surface, possibly a wall or a large object, with a bright, circular light source visible in the upper left quadrant. The image has a high-contrast, almost abstract quality due to the heavy shadows and the bright light source.
